

The factored code allowed the code to be more efficient. The lambdas created a smaller memory shortage and shortened the code blocks. The logical structure of the code was more readable and less clunky, making it more concise for the user to understand. The challenges are that the code needs to incorporate the legacy code and the new code. Picking the code chunks to stay and to leave can be hard because I thought I could get it all into the new updated code, but I could not.
